

Systemic Anti Cancer Therapy Protocol

## Encorafenib and Binimetinib Malignant Melanoma

PROTOCOL REF: MPHAENBISK  
(Version No. 1.2)

### Approved for use in:

- Unresectable stage III or stage IV BRAF V600 mutation positive malignant melanoma until disease progression or unacceptable toxicity.
- Patients not previously treated with a BRAF V6000 and MEK inhibitor for malignant melanoma.
- No treatment breaks for more than 6 weeks beyond the expected 4 weekly cycle length
- ECOG PS 0-1

**Blueteq registration required: refer to blueteq for detailed eligibility criteria**

### Dosage:

Drug	Daily Dose	Route	Frequency
Binimetinib	45mg BD	Oral	Supplied every 28 days until disease progression or unacceptable toxicity.
Encorafenib	450mg BD	Oral	

### Administration and Counselling Points:

- Binimetinib tablets are available as 15mg tablets.
- Encorafenib capsules are available as 50mg and 75mg capsules.
- Patients should be encouraged to take treatments with water and they may be taken with or without food. These oral medications should be swallowed whole, not crushed or chewed.
- In the case of vomiting after administration of either drug, the patient should not take an additional dose and should take the next scheduled dose.
- If a dose of binimetinib is missed, it should not be taken if it is less than 6 hours until the next dose is due.

Issue Date: June 2023 Review Date: June 2026	Page 1 of 10	Protocol reference: MPHAENBISK
Author: Hugh O'Neill	Authorised by: DTC	Version No: 1.2

- If a dose of encorafenib is missed, the patient should only take the missed dose if it is more than 12 hours until the next scheduled dose.
- Patient should avoid any food or drink containing grapefruit and grapefruit juice, Seville oranges, or pomelos within 7 days prior to start of treatment and until treatment discontinuation, as these have been shown to inhibit CYP3A4 activity.
- Patients should be made aware of potential for fatigue, dizziness or eye problems that might affect their ability to drive or operate machinery.
- Binimetinib contains a small amount of lactose, which should be considered where patients have severe lactose intolerance.

## Emetogenic risk:

Mildly emetogenic.

## Supportive treatments:

Nil

## Dosing in renal and hepatic impairment:

<b>Renal</b>	<b>Binimetinib</b>	No dosage adjustment is required in patients with renal impairment.
	<b>Encorafenib</b>	No dosage adjustment is required in patients with mild or moderate renal impairment. For patients with severe renal impairment, use with caution.

<b>Hepatic</b>	<b>Binimetinib</b>	No dose adjustment is required in patients with mild hepatic impairment. As encorafenib is not recommended in patients with moderate or severe hepatic impairment, administration of binimetinib is not recommended in these patients as they should usually be given in combination.
	<b>Encorafenib</b>	For patients with mild impairment, administration with encorafenib should be undertaken with caution at a reduced dose of 300mg OD. In the absence of clinical data, encorafenib treatment is not recommended in patients with moderate or severe hepatic impairment.

## Drug Interactions:

The number of affected medicinal products expected to interact with these drugs are extensive; although the magnitude of the interaction will vary. Groups of medicinal products that can be affected include, but are not limited to CYP3A4, UGT1A1 inhibitors and inducers, CYP1A2 inducers, P-gp transport inducers, (refer to summary of product characteristics for a current list of potential medicine interactions)

Issue Date: June 2023 Review Date: June 2026	Page 3 of 10	Protocol reference: MPHAENBISK

## Investigations and treatment plan:

	Pre	Cycle 1	Cycle 2	Cycle 3	Ongoing
Informed Consent	x				
Clinical Assessment	x	x		x	At baseline, month 1 and then every 3 months thereafter
SACT Assessment (to include PS and toxicities)	x	x	x	x	Every cycle
FBC	x	x	x	x	Every cycle
U&E & LFTs & LDH & Mg2+	x	x	x	x	Every cycle
ECG and Echo/MUGA scan	x				*As clinically indicated
Creatinine phosphokinase (CK)					
Blood pressure and temperature measurements					
CT scan	x			x	Every 12 weeks/if clinically indicated
Dermatological examination	x			x	Every 3 months
Ophthalmic examination	x	x	x	x	
Height	x				
Weight	x	x	x	x

Author: Hugh O'Neill	Authorised by: DTC	Version No: 1.2

# SACT PROTOCOL

\* If any complaints of chest pain/shortness of breath/palpitation or hypertension present – escalate to ANP/medical review for ECG.

\*\* If any rash observed/reported – escalate to ANP/medical review.

Pregnancy test if applicable.

Issue Date: June 2023 Review Date: June 2026	Page 5 of 10	Protocol reference: MPHAENBISK
Author: Hugh O'Neill	Authorised by: DTC	Version No: 1.2

## Main Toxicities

System Organ Class	Adverse Reaction
Pyrexia	Pyrexia: Therapy should be interrupted if the patient's temperature is $\geq 38.5^{\circ}\text{C}$ . Patients should be evaluated for signs and symptoms of infection. Treatment can be restarted once the fever resolves with appropriate prophylaxis using non-steroidal anti-inflammatory medicinal products or paracetamol. If fever is associated with other severe signs or symptoms, treatment should be restarted at a reduced dose once fever resolves and as clinically appropriate.
Cardiovascular	Deep vein thrombosis (DVT)/Pulmonary embolism (PE). QT prolongation. Haemorrhage. LVD (ejection fraction decreased, cardiac failure and ejection fraction abnormalities). Increases in blood pressure. The choice of antihypertensive treatment should be individualised to the patient's clinical circumstances and follow standard medical practice – use NICE Clinical Guideline CG 127 – Hypertension in adults diagnosis and management Accessible here: <a href="https://www.nice.org.uk/guidance/CG127Hypertension%20in%20adults%3A%20diagnosis%20and%20management%20 %20Guidance%20and%20guidelines%20 %20NICE">https://www.nice.org.uk/guidance/CG127Hypertension in adults: diagnosis and management   Guidance and guidelines   NICE</a>
Ocular	Treatments are associated with ocular toxicities, these include papilledema, central serous retinopathy (CSR) and retinal vein occlusion (RVO), uveitis (including chorioretinitis, choroiditis, retinitis, vitritis, cyclitis, iridocyclitis, iritis, and uveitis).
Haematological	Neutropenia, Anaemia, Thrombocytopenia
Dermatological	Cutaneous toxicities including rash, photosensitivity, palmar-plantar erythrodysesthesia (hand-foot skin reaction or HFSR), hyperproliferative skin diseases (hyperkeratosis, keratoacanthoma).  Skin papilloma, Dermatitis acneiform, Erythema, Panniculitis  Cutaneous squamous-cell carcinomas/keratoacanthomas and new primary melanomas have been reported as a possible class effect of BRAF inhibitors. Dose interruptions

Issue Date: June 2023 Review Date: June 2026	Page 6 of 10	Protocol reference: MPHAENBISK
Author: Hugh O'Neill	Authorised by: DTC	Version No: 1.2

	or modifications are not required for squamous-cell carcinomas/keratoacanthoma.
Gastrointestinal	Diarrhoea, nausea, vomiting constipation abdominal pain. Colitis and gastrointestinal perforation, pancreatitis including fatal outcome, have been reported.
Additional adverse reactions	<p>Musculoskeletal and connective tissue disorders: Myalgia, pain in extremities, back pain. Rhabdomyolysis. Signs or symptoms of rhabdomyolysis should warrant an appropriate clinical evaluation and treatment as indicated.</p> <p>Immune system disorders: Hypersensitivity</p> <p>Fatigue, peripheral oedema, peripheral neuropathy, headaches, dizziness.</p> <p>Investigations: Blood alkaline phosphatase increased, blood creatinine increased, amylase increased, lipase increased</p> <p>Hepatic disorders, renal dysfunction, peripheral oedema.</p>

The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details

## Dose Modifications and Toxicity Management:

CTCAE version 4 Grade of toxicity	Action and Dose Modification
<b>Grade 1</b>	<ul style="list-style-type: none"> <li>Continue treatment at current dose level</li> <li>Monitor closely</li> <li>Provide supportive care according to institutional standards</li> </ul>
<b>Grade 2 (Tolerable)</b>	<ul style="list-style-type: none"> <li>Monitor closely</li> <li>Provide supportive care</li> <li>Interrupt treatment if clinically indicated – when toxicity resolves to grade 1 or baseline, restart treatment at current dose level</li> </ul>
<b>Grade 3 (intolerable or recurrent Grade 2)</b>	<ul style="list-style-type: none"> <li>Interrupt treatment for up to 4 weeks</li> <li>Monitor closely</li> <li>Provide supportive care</li> </ul>

	<ul style="list-style-type: none"> <li>When toxicity resolves to grade 1 or baseline, restart treatment <b>reduced by one dose level</b>, if it does not improve, both drugs should be permanently discontinued.</li> <li>If the grade 3 toxicity recurs, interrupt treatment</li> <li>When toxicity resolves to grade 1 or baseline, restart treatment <b>reduced by another dose level</b>, if it does not improve, both drugs should be permanently discontinued.</li> </ul>
<b>Grade 4</b>	<ul style="list-style-type: none"> <li>Interrupt treatment</li> <li>Monitor closely</li> <li>Provide supportive care</li> <li>Restart with treatment <b>reduced by one dose level</b> once toxicity resolves to grade 1 or baseline, if it does not improve, both drugs should be permanently discontinued.</li> <li>If the grade 4 toxicity recurs, either <b>permanently discontinue treatment or, if the patient is clinically benefiting, continuation of treatment may be considered by consultant oncologist</b></li> </ul>

For specific guidance on dose modifications for cardiac events, creatine phosphokinase (CK), venous thromboembolism (VTE), liver abnormalities and interstitial lung disease/pneumonitis please refer to the summary of product characteristics.

Retinal vein occlusion (RVO) and Retinal pigment epithelial detachment (RPED) Urgent ophthalmological assessment is recommended if patients report new visual disturbances such as diminished central vision, blurred vision, or loss of vision at any time while on therapy. In patients who are diagnosed with RVO, treatment should be permanently discontinued.

### Recommended dose modifications:

If treatment-related toxicities occur, for the majority of cases, both treatments should be simultaneously reduced, interrupted or discontinued. Exceptions where dose modifications are necessary for encorafenib only (AEs related primarily to encorafenib) are palmar-plantar erythrodysesthesia syndrome (PPES), uveitis/iritis/iridocyclitis and QTc prolongation.

Exceptions where dose modifications are necessary for Binimetinib only (AEs primarily related to binimetinib) are: RPED, retinal vein occlusion, interstitial lung disease/pneumonitis, cardiac dysfunction, CK elevation, rhabdomyolysis and VTE.

Issue Date: June 2023 Review Date: June 2026	Page 8 of 10	Protocol reference: MPHAENBISK
Author: Hugh O'Neill	Authorised by: DTC	Version No: 1.2

Dose Level	Binimetinib	Encorafenib
<b>Starting Dose</b>	45mg TWICE daily	450mg ONCE daily*
<b>1<sup>st</sup> Dose reduction</b>	30mg TWICE daily	300mg ONCE Daily
<b>2<sup>nd</sup> Dose reduction</b>	Discontinue	225mg ONCE Daily
<b>3<sup>rd</sup> Dose reduction</b>		There is limited data for dose reduction to 100mg once daily. If unable to tolerate 100mg once daily, discontinue.

\*Administration of encorafenib at a dose of 450 mg once daily as a single agent is not recommended. If binimetinib is temporarily interrupted, encorafenib should be reduced at 300 mg once daily during the time of binimetinib dose interruption as encorafenib is not well-tolerated at the dose of 450mg as a single agent.

## Haematological Toxicity:

Proceed in day 1 if-

ANC $\geq 1 \times 10^9$ /L	Plt $\geq 100 \times 10^9$ /L
-----------------------------	-------------------------------

Delay 1 week and refer to advice below-

ANC $< 1 \times 10^9$ /L	Plt $\leq 99 \times 10^9$ /L
--------------------------	------------------------------

These haematological guidelines assume that patients are well with good performance status, that other acute toxicities have resolved and the patient has not had a previous episode of neutropenic sepsis.
