

Systemic Anti-Cancer Treatment Protocol

Cyclophosphamide, Doxorubicin & Vincristine (CAV)

**PROTOCOL REF: MPHACAVLU
(Version No: 1.0)**

Approved for use in:

Second line chemotherapy in small cell lung cancer
Small cell cancer of any site, e.g. bladder

Dosage:

Drug	Dose	Route	Frequency
Cyclophosphamide	750mg/m ²	IV	Every 21 days
Doxorubicin	50mg/m ²	IV	Every 21 days
Vincristine	1.4mg/m ² (max 2mg)	IV	Every 21 days

Cycle is repeated every 21 days for 6 cycles followed by review

Supportive Treatments

Anti-emetic risk - Moderate

Dexamethasone 4mg twice daily for 3 days

Domperidone 10mg tablets, to be taken up to three times a day when required

Extravasation risk:

Doxorubicin is a vesicant. Erythematous streaking along the vein proximal to the site of injection has been reported, and must be differentiated from an extravasation event.

This reaction usually subsides within 30 minutes.

Cyclophosphamide – Non vesicant

Issue Date: October 2017 Review Date: October 2020	Page 1 of 5	Protocol reference: MPHACAVLU
Author: Tara Callagy	Authorised by: Dr Carles Escriu & DTC	Version No: 1.0

Vincristine – vesicant

Refer to the network guidance for the prevention and management of extravasation

Administration:

Day	Drug	Dose	Route	Diluent and rate
1	Dexamethasone	12mg	PO	30mins before chemotherapy
	Ondansetron	24mg	PO	30mins before chemotherapy
	Doxorubicin	50mg/m ²	IV	Over 15 to 30 minutes alongside fast flowing sodium chloride 0.9%
	Vincristine	1.4mg/m ² (max 2mg)	IV	Sodium chloride 0.9% 50mL over 15 minutes
	Cyclophosphamide	750mg/m ²	IV	Over 30 minutes

Notes:

- Nasal stuffiness can occur immediately with administration of cyclophosphamide, if uncomfortable for the patient the drug can be slowed down
- Encourage an oral fluids intake of 2 litres per day to promote urinary output & prevent chemical cystitis with cyclophosphamide.
- Red urine is likely following doxorubicin

Maximum cumulative doxorubicin dose is 450 to 550 mg/m².

Cardiac ejection fraction must be > 50% to proceed with the regimen

Perform baseline LVEF evaluation on patients suspected of having impaired cardiac contractility

Main Toxicities:

Myelosuppression: neutropenia, thrombocytopenia, anaemia

Alopecia, nausea and vomiting, diarrhoea, stomatitis,

Hypersensitivity: including anaphylaxis, rash and oedema

Issue Date: October 2017 Review Date: October 2020	Page 2 of 5	Protocol reference: MPHACAVLU
Author: Tara Callagy	Authorised by: Dr Carles Escriu & DTC	Version No: 1.0

Cyclophosphamide

Haematuria may occur during or after treatment.
 Skin pigmentation, typically affecting the palms and nails of the hands and the soles of the feet
 Inappropriate secretion of anti-diuretic hormone, fluid retention and hyponatremia, myocardial toxicity especially at high dosage.
 Rarely pulmonary fibrosis, hepatic toxicity

Doxorubicin

Cardiotoxicity life-threatening congestive cardiomyopathy, sinus tachycardia, ventricular tachycardia, tachyarrhythmia, bradycardia.

Vincristine

Neuropathy, arthralgia, myalgia
 Polyuria, dysuria and urinary retention due to bladder atony have occurred.
 Hypertension and hypotension

Investigations:

	Pre	Cycle 1	Cycle 2	Cycle 3	Cycle 4	Ongoing
Medical Assessment	X		X		X	At end of treatment
Nursing Assessment		X	X	X	X	Every cycle
Respiratory Rate and O ₂ sats	X	X	X	X	X	Every cycle
FBC	X		X	X	X	Every cycle
U&E & LFT	X	X	X	X	X	Every Cycle
Serum Cr	X	X	X	X	X	Every cycle
MUGA**	X					If clinically indicated
CT scan	X				X	At end of treatment
Informed Consent	X					
ECG	X					As clinically indicated
Blood pressure	X					Repeat if clinically indicated

PS recorded	X	X	X	X	X	Every cycle
Toxicities documented	X	X	X	X	X	Every cycle
Weight recorded	X	X	X	X	X	Every cycle

*Calculate CrCl if changes of > 30% to Sr Creatinine

**Baseline MUGA if suspected cardiac contractility impairment – repeat during treatment if clinically indicated

Dose Modifications and Toxicity Management:

Haematological Toxicity:

Proceed on day 1 if-

Plt $\geq 100 \times 10^9/L$	ANC $\geq 1.0 \times 10^9/L$
------------------------------	------------------------------

Delay 1 week on day 1 if-

Plt $\leq 99 \times 10^9/L$	ANC $\leq 0.9 \times 10^9/L$
-----------------------------	------------------------------

These haematological guidelines assume that patients are well with good performance status, that other acute toxicities have resolved and the patient has not had a previous episode of neutropenic sepsis.

If > 1 week delay consider 25% dose reduction for cyclophosphamide and doxorubicin for subsequent cycles

Hepatic impairment:

	Doxorubicin	Vincristine	Cyclophosphamide
Bilirubin $\mu\text{mol/L}$	Dose	Dose	Dose
24 to 50	50%	50%	100%
51 to 85	25%	50% (if ALT within normal limits)	75%
Above 85	Omit	Omit	Omit

Renal impairment:

No dose adjustments are required for moderate renal impairment
